### Progress Notes

David P Hudesman, MD (Physician) • Medicine, Gastroenterology

#### GI outpatient note:

John Glebocki is a 40 y.o. male with ulcerative colitis who has not been in remission since diagnosis in 2014, with diarrhea, abdominal pain, and weight loss.

#### Presentation:

He was diagnosed with ulcerative colitis in 2014 when he initially presented with bloody mucousy diarrhea over a couple of months. Initially he had an anal fissure.

Colonoscopy was performed which showed ulcerative proctitis.

He was initially started on uceris, Lialda and canasa. He had a good response - bleeding resolved, but did not feel like he was in remission.

Since diagnosis from 2014 to 8/19, he has had at least 3 flares a year treated with either cortifoam or uceris foam and oral uceris. He was maintained on oral mesalamine.

Last time he has been on uceris foam was in 7/19.

Currently, he is having 12-24 loose small volume non bloody bowel movements daily. (+) urgency and tenesmus. Multiple nocturnal bowel movements. He has abdominal cramping when he has urgent bowel movements. Denies n/v. Denies fevers. Intermittent night sweats. He lost 5 pounds over the past year. Denies joint pains, cyc pain, skin rash, or mouth sores.

#### HEALTH MAINTENANCE:

Flu vaccine - recommended for next season

PNA vaccine - recommended

Had chicken pox as a child

Abdomen: soft, non tender, non distended, +bs, no rebound or guarding

Neurological: grossly intact

Extremities/Musculoskeletal: no clubbing, cyanosis, or edema

Assessment: 40 y.o. male with ulcerative colitis who has not been in remission since diagnosis in 2014, with diarrhea, abdominal pain, and weight loss.

Plan:

- Counseled on ulcerative colitis, discussed etiology and natural history of disease. We discussed that symptoms do not always correlate with bowel damage/inflammation
- Counseled on diet, recommended high protein and calorie diet, avoid processed foods

- Counselor on medications, discussed mechanism of action and risks of mesalamine including renal insufficiency

- Check labs and vitamin levels

- Check stool studies for infection

- Colonoscopy to evaluate the extent and severity of disease

- Start prednisone 20mg po bid

Risks of prednisone explained to the patient. Risks include acne, weight gain, insomnia, irritability, osteoporosis, avascular necrosis, and long term complications of HTN, impaired fasting glucose and cataracts. He understands these risks and agrees to prednisone.

- Cont mesalamine 4.8 grams daily

- Imodium pm

- Recommended flu vaccine next season

- Recommended prevnar then pneumovax 2-12 months later

- All questions answered

### Progress Notes

David P Hudesman, MD (Physician) • Medicine, Gastroenterology

#### GI outpatient note:

John Glebocki is a 40 y.o. male with ulcerative colitis who has not been in remission since diagnosis in 2014, with severe UC on remicade.

#### Presentation:

He was diagnosed with ulcerative colitis in 2014 when he initially presented with bloody mucousy diarrhea over a couple of months. Initially he had an anal fissure.

Colonoscopy was performed which showed ulcerative proctitis.

He was initially started on uceris, Lialda and canasa. He had a good response - bleeding resolved, but did not feel like he was in remission.

Since diagnosis from 2014 to 8/19, he has had at least 3 flares a year treated with either cortifoam or uceris foam and oral uceris. He was maintained on oral mesalamine.

Last time he has been on uceris foam was in 7/19.

Prednisone 20mg po bid started end of 8/19 and tapered off over 3 months.

#### Colonoscopy 9/5/19: Findings:

The perianal and digital rectal examinations were normal.  
Severe inflammation characterized by congestion (edema),  
erosions,  
erythema, friability, granularity and patchy shallow ulcerations  
was  
found throughout the colon. Biopsies were taken with a cold  
forceps for  
histology.  
The terminal ileum appeared normal. Biopsies were taken with a  
cold  
forceps for histology.

Impression: - Endoscopically Severe Ulcerative Pancolitis  
 (Mayo -3)

Remicade started on 10/2/19. His third dose was 11/13/19.

He stopped prednisone and imodium on 11/13/19.

Currently, he is having 3 soft non bloody bowel movement daily. Denies urgency, tenesmus, or nocturnal bowel movements. Denies abdominal pain, n/v. Denies fevers, chills, or sweats. Eating well and gaining weight. Denies joint pains, eye pain, skin rash, or mouth sores.

URI.

**Cardiovascular:** nl s1, s2, no murmurs

**Pulmonary:** clear to auscultation bilaterally, no wheezing

**Abdomen:** soft, non tender, non distended, +bs, no rebound or guarding

**Neurological:** grossly intact

**Extremities/Musculoskeletal:** no clubbing, cyanosis, or edema

**Assessment:** 40 y.o. male with ulcerative colitis who has not been in remission since diagnosis in 2014, with severe UC on remicade,

**Plan:**

- Feeling well since starting remicade

- Cont remicade 5mg/kg q 8 weeks

Risks of anti-TNF reviewed with the patient. Risks explained include infection, serious infection, lymphoma, hepatosplenic T cell lymphoma, skin cancer,

cardiac side effects, neurologic side effects, infusion and injection reactions, and a lupus like reaction. Pt understands these risks.

Check remicade level and antibody to remicade then will adjust dose

- Cont mesalamine 4.8 grams daily
- Check labs and vitamin levels
- Colonoscopy in 3/20 to evaluate the extent and severity of disease

# QUANTIFERON TB GOLD PLUS

Results

Status: Final result (Collected: 8/27/2019 15:06)

8/29/2019 2:46 PM - Interface, Sunquest In

Component	Value	Ref Range & Units	Status
Interpretation for	Negative	Negative	Final
Quantiferon TB Gold Plus			
TB1-Nil	0.010		Final
TB2-Nil	0.010		Final
MITOGEN-NIL	8.950		Final
Nil	0.010		Final

Comment:

Component	Value	Ref Range & Units	Status
-----------	-------	-------------------	--------

(NOTE)

The quantiFERON-TB Gold Plus software interprets the four values, Nil, TB1-Nil, TB2-Nil and Mitogen-Nil, to provide the qualitative result (Negative, Positive, or indeterminate). The Nil value represent nonspecific reactivity detected within the patient specimen, elevated levels of circulating interferon-gamma in the Nil sample may occur with the presence of heterophile antibodies, or to intrinsic interferon-gamma secretions. In order for the test to be valid, the Nil tube must have a value of less than or equal to 8.0 IU/mL.

The TB1-Nil represent CD4 T helper cells response to the TB antigens. The TB2-Nil represents CD4 and CD8 T cell response to the TB antigens.

\*\* For a test to be positive, the TB1-Nil and or the TB2-Nil must be greater than 0.35 and greater or equal to 25% of the Nil value.\*\*

The Mitogen minus-Nil value serves as the positive control for the patient specimen, demonstrating successful lymphocyte activity. A Low response to Mitogen (<0.5 IU/mL) generates an indeterminate result when a blood sample also has a negative response to the TB antigen. An overall negative quantiFERON TB-Gold Plus result does not completely rule out TB infection. An overall positive result does not differentiate active from latent tuberculosis.

During M. tuberculosis infection, CD4 T cells play a critical role in immunological control through their secretion of the cytokine interferon gamma. CD8 T cells produce interferon gamma and other soluble factors to suppress M. tuberculosis growth, kill infected cells and directly lyse intracellular Mycobacteria. Moreover, research indicates that TB-specific CD8 T cells that produce interferon gamma have been more frequently detected in those with active TB vs latent infection, associated with recent exposure to TB and detectable in active TB subjects with HIV co-infection and young children.

Performed by NYU Langone Hospitals, Tisch Hospital Clinical Labs. 560 First Avenue, NY, NY, 10016. Director: Maria E. Agüero Rosenfeld MD.
